prevent heart disease, and have a better
skin.**

7 Health Benefits of Coconut Oil

How Coconut Oil helps you lose weight, prevent heart disease, and have a better skin.

1. How Coconut Oil is good for your heart?

We have been told for decades that saturated fats are bad for our health. In the 1950's a study carried out by Dr. Keys linked saturated fats to higher blood cholesterol and heart disease. This study researched seven countries and was the largest nutrition study to date.

It examined the relationship between lifestyle, diet, coronary heart disease and stroke. Key conclusions were drawn but proved to be wrong decades later. Prior to the study heart disease was seen as a natural part of aging, now it was linked for the first time to nutrition as a contributing factor.

Dr. Keys findings later formed the foundation for the mediterranean diet that became popular in the 1970s. But there were lots of flaws in the study.

The 7 countries were not selected randomly, they were specifically selected to support Dr. Keys claims. For instance, people in Crete were studied, a Greek island where people appeared to live a long life following a diet which included a very low intake of saturated fats. But that happened particularly in the period after World War 2 when the country was suffering hardship and people had to do without meat and cheese, what they usually consumed plenty of.

However, the flaws were only revealed in the 2000s, long after the war against saturated fats was started and a whole generation followed advice of a flawed scientific study. Although saturated fats had been cut out of our diet for half a century, people have become sicker and obese.

One of the main counter-productive factors was that a diet low in saturated fats has led people to eat more carbohydrates, which had already been linked to heart-disease, type II diabetes and obesity in the 1950s.

Furthermore people increased the intake of vegetable oils significantly over the past 50 years. Finally in 2014 a study from Cambridge University claimed that saturated fat does not cause heart disease. The study examined data from 600,000 participants in 72 countries and found that there was no correlation between the subject's total consumption of saturated fats and the occurrence of heart disease.

So, now that we know that saturated fats are not all too dangerous for us, let's look at coconut oil and find out what health benefits it has.

The prevention of heart disease is perhaps the most widely contested area of debate in coconut oil research. The high amount of saturated fats in coconut oil would seem to indicate that it would have a negative impact on your health by creating more fatty tissues. However research into the chemical composition of these saturated fats has shown that they are primarily medium chain triglycerides, the least harmful, and most beneficial, form of saturated fats your body can use.

Worldwide cardiovascular disease causes over 12.5 million deaths a year. The most common form of this disease is coronary artery disease which results from the build-up of fat, plaque and scar tissue around the arteries.

This means that coconut oil would seem an unlikely candidate as a dietary supplement to decrease your risk of heart disease but it actually isn't. This has all to do with the type of saturated fats we ingest on a regular basis. Sri Lanka's for example have the lowest risk of cardiovascular disease in the world and their primary cooking oil comes from coconuts. This may seem incidental but there has been a marked increase in cardiovascular disease in Sri Lanka and India that fits with the increased use of vegetable oils which have replaced traditional cooking aids and consumables.

The saturated fats in most western diets are of a far worse kind. These are high chain triglycerides that the body cannot break down as efficiently as medium chains. This means that they build up as fatty deposits around your heart and arteries increasing the risk of coronary heart disease. Replacing your oils and margarines with coconut oil therefore actually decreases your risk of heart disease and will help you lose weight.

Clearly then we can see that despite appearance coconut oil is actually a better alternative to other oils and should definitely be used as often as possible in order to improve your diet and reduce the risks of heart diseases.

2. How Coconut oil helps you lose weight

Many people think that because virgin coconut oil has a high proportion of saturated fat it is bad for you to eat. This is one of the greatest myths surrounding coconut oil and it is now time to bust this myth and see how you can use coconut oil as a an aid to weight loss.

The chemical make-up of coconut fats is that 90% of coconut oil is saturated fat. Sounds like a nightmare, doesn't it, but a closer examination reveals the surprising truth.

This is because most of the saturated fatty acids in coconut oil are known as **medium chain triglycerides**. Medium chain triglycerides are actually easier for your body to break

down than other saturated fats. Especially those found in fast food and other artificially created products.

This is because there are fundamental differences in the chain composition in these fats which means they are harder for your body to breakdown - which in turn means they are more likely to accumulate in your arteries and in your skin tissue. Further, the saturated fats in coconut oil - especially the **Lauric acid** actually increase the body's metabolism and promote optimal health of the thyroid and enzymes systems.

Having a high metabolism means that the body burns calories at an increased rate. This is due to the acidity of your stomach acid and how effectively it can convert food to energy. Having a healthy gut will greatly increase your chances of having a high metabolism and help you start shedding weight.

The enzymes contained within coconut oil actually act as catalysts to your stomach acid and help you break down fat at an increased rate; and as your metabolism is also increased you can burn a higher proportion of the calories you take in. They also help to promote a healthy gut by fighting bacteria and strengthening the stomach lining. Hence coconut oil actually is much better for you to use in cooking and food than other alternatives as it has added benefits not found in vegetable and olive oil. Virgin coconut oil as it contains 50% Lauric acid is definitely well worth including in your diet.

The easiest ways to do this are to replace your cooking oil with coconut oil - which incidentally is much more complimentary to the tastes of many foods, especially curries and stir fry's. Alternatively you can also use coconut milk more regularly in your cooking as it can be a key ingredient in a variety of delicious curries.

3. How Coconut oil aids to digestion

Coconut oil has long been held to be a useful supplement to aid in digestion. This is one of the key reasons it is the primary ingredient in many curry sources - and why curry goes down so well. Coconut oil has strong anti-microbial benefits which when ingested help you fight off nasty bacteria and bolster your immune system.

Many digestive problems are caused by the presence of microbes in the food we eat. We have a natural set of microbes in our stomach acid that aid digestion but these often react negatively with certain enzymes found in other foods. This means that the key way virgin coconut oil can help our digestion is by curing indigestion.

Indigestion is primarily caused by acid in your stomach irritating the stomach lining and the top of your small intestine. The most common process that causes it is known as acid reflux. This is most commonly caused by bad diet and obesity as well as stomach ulcers and other stomach infections.

The saturated fats in coconut oil, especially Lauric acid and Capric acid, aid your stomach, and digestive track, in neutralising micro bacteria. These fats help remove parasitic bacteria and fungi keeping your digestive tract and stomach at its optimal performance.

Whilst these benefits are great if you have indigestion they also help the clean and healthy running of the rest of your body too. Coconut oil is rich in vitamins and minerals itself but the fatty acids within it actually encourage the absorption of most other vitamins and minerals into your body. This is because the enzymes that are released when the fatty acid chains break down act as a catalyst for the absorption of other vitamins and minerals.

But before you go guzzling gallons of coconut oil be aware that this would have a negative impact on your overall health. Whilst coconut oil is a great way to cure indigestion and is beneficial to your digestive system in general, overuse of coconut oil can have negative consequences. This is because whilst the saturated fats in virgin coconut oil are not unhealthy in small doses large amounts will be equivalent to eating lots of unhealthy meat and dairy products. So it is best to use coconut oil in cooking without pouring the entire bottle over every meal.

4. How Coconut Oil is an aid to your immune system

Maintaining a well-balanced diet and carefully monitoring your daily food and drink intake are central to keeping a well-balanced and healthy immune system. Your immune system has to fight off scores of bacteria every day and having a low immune system means you are more likely to catch viruses and other illnesses.

Coconut oil has great natural health benefits and works as an effective cure for a number of common illnesses including eczema, indigestion and a variety of skin diseases like age spot. However coconut oil can also aid your immune system in a number of surprising ways. The key way coconut oil can boost your immune system is through the ingestion of saturated fats, the most beneficial of which are medium chain triglycerides.

These are the most easily digestible saturated fats as the body transports them straight to the liver where they are not used for the production of fat, so you don't have to be overly worried about increasing your cholesterol as you boost your immune system. Medium chain triglycerides are used by your immune system to create antimicrobials, which we more commonly known as antibodies. Antibodies are the primary defence mechanism your body has when fighting infections and viruses so having moderate amounts of saturated fats is necessary to keep your antibody production up.

The fats in coconut oil contain antimicrobial lipids which have anti-viral and anti-fungal properties. Coconut oil contains Lauric, Caprylic and Capric acids which, when broken down, are converted into specific antibodies used in your body's defences against a range of diseases including herpes, influenza and other infections ordiseases. Having the right

antibodies to fight specific bacteria is central to your body's well-being so adding some coconut oil to your diet is an easy way to ensure you stay happy and healthy.

5. How Coconut oil helps you fight infections

We've already seen that coconut oil can help fight a variety of infections and that it aids your immune system thanks to the fatty acids such as lauric acid and capric acid. However the natural health benefits of coconut oil actually go far beyond this as it is a versatile treatment for a variety of internal and external infections.

Firstly externally coconut oil can be used to treat a variety of skin afflictions and is brilliant for cuts, scrapes and bruises. On your skin virgin coconut oil is aptly suited to preventing common skin afflictions such as eczema and other rashes as it creates an impermeable layer of oil between your skin and the air.

Whilst usually this would result in your skin becoming unhealthy and not being able to breathe properly the chemical composition of coconut oil actually aerates the skin and moisturises it at the same time. You shouldn't keep yourself covered in coconut oil twenty four seven but applying a layer twice a day will keep your skin irritations safely at bay and leave you with healthier skin.

On cuts, bruises and scrapes virgin coconut oil helps in the same way as above, by keeping the area free from infection. Yet the moisturising effects also help heal the skin by giving it the nutrients it needs to rejuvenate and repair skin tissue. The nutrients in coconut oil not only help heal your skin but they also help tighten the skin - this is great for removing stretch marks and minimising.

Secondly the enzymes in coconut oil are known to kill many viruses including influenza, measles, herpes or hepatitis. This means that coconut oil can actually protect you from catching some of the worst diseases we are exposed to in the modern world. The enzymes work by simply decomposing the harmful viruses, thereby neutralising any potential they have to create negative effects.

Thirdly coconut oil is a great treatment for candidiasis and other yeast. Organic coconut oil is one of the most efficient natural health aids in fighting candida off completely. Changing your diet in this simple way can really help relieve you of candidiasis forever. Candida is notoriously hard to remove from the body as the source of the infection is not necessarily the same as the location of the infection itself.

Candida grows in a low PH and overly toxic environment. If you are overweight, eat a lot of junk food or underweight and sedentary your body's skin and immune system are less tolerant, meaning you are likely to develop candida or yeast infections much more frequently. In your diet coconut oil helps bolster the immune system as well as being a much better source of saturated fat than junk food.

Applied externally the nutrients in coconut oil help to protect your skin and create a barrier to external free radicals meaning that repeat infections are unlikely. The topical application of coconut oil will also help soothe the skin meaning you won't suffer from as much irritation. Coconut oil acts as a fungicide by literally breaking down the fungus. This makes coconut oil one of the best natural health remedies to a huge variety of common afflictions. It really is a wonder of the natural world.

6. How Coconut Oil is good for your hair

Coconut oil has long been regarded as one of the best hair conditioning natural health products in the natural world. Many people worldwide use coconut oil as their sole hair conditioning product as it is relatively cheap and gives remarkable results.

The benefits of coconut oil for your hair are numerous. Coconut oil helps keep your hair fully moisturised, it promotes full growth and creates strong hair whilst keeping the scalp free from flakes.

Whilst many companies use tiny amounts of virgin coconut oil in their high end products a lot of people are now turning to pure virgin coconut oil for the benefits it brings. The key benefits of using coconut oil or even coconut oil cream in your hair can be exposed by looking at the chemical properties of coconut oil. Often people proscribe coconut oil as a remedy for hair loss - or at least to slow the onset of hairless and we can soon see why.

Lauric acid is found primarily in the oil produced from coconuts. One of the primary causes of hair loss and recession of the hair line is the action of microbes on the scalp and at the base of the follicles. Lauric acid acts as an anti-microbial oil that prevents the build-up of damaging microbes thus preventing hair loss and stimulating fresh strong growth. This means that not only is coconut oil great for your hair but it can also prevent the loss of hair if used regularly.

Virgin coconut oil contains a high yield of not only Lauric acid but Capric acid as well. **Capric acid** is another anti-microbe that works in a similar way to Lauric acid. It tackles microbes at the source preventing further spread and loss of hair whilst stimulating new hair growth.

Vitamin E helps keep the skin in top condition and is one of the key ways in which your hair retains its shine and bounce. The fatty acids in coconut oil serve as a great anti-dandruff mechanism that far outshines most anti-dandruff shampoos. Regular application softens and moistens the skin reducing the accumulation of hair and flakes.

The benefits of virgin coconut oil for your hair are fantastic. This is why more and more people are replacing their traditional shampoos and conditioners with either pure or high density coconut oil products. Many people have now started using coconut oil for stylistic

reasons as it acts in a similar way to hair wax or gel - without producing the flakes of typical wax and without damaging the hair's strength. This is due to coconut oils ability to retain moisture at almost all temperatures.

7. Coconut oil and Skincare

Coconut oil has a large number of fantastic benefits for your skin as well.

The first as we have already seen is the great benefit of **Vitamin E**. Vitamin E keeps your skin healthy, spot free and protects against skin cancer. Vitamin E in coconut oil acts as an antioxidant - meaning that it protects skin cells from UV light, pollution and the negative effects of smoke and other "free radicals". The most notable of these is of course the prevention of skin cancer making coconut oil one of the most beneficial forms of sun screen available.

Vitamin E also helps reduce the appearance of stretch marks and prevents the appearance of age spots by rejuvenating the skin cells over your body. As coconut oil has a high yield of vitamin E many people are now using it as a substantive replacement for expensive sun-creams, or as a supplement to sun screen as it is less harmful to the skin.

Coconut oil also has fantastic moisturising benefits that extend beyond simply the high content of vitamin E. Virgin coconut oil is a highly effective and completely natural moisturiser. It is unlikely to create adverse reactions as it is completely natural meaning that, unlike many moisturisers, you don't have to worry about rashes and unsightly blemishes appearing on your skin. Further compared to most moisturising creams, which often carry an extortionate price tag, coconut oil is cheap to buy and lasts long. In terms of natural remedies coconut oil treats and alleviates many common skin conditions **including eczema, dermatitis and psoriasis**.

Finally then coconut oil actually works as an **anti-aging** cream. The antioxidants of vitamin E provide an initial layer of protection against the sun but the combination of this with the Lauric acid found in coconut oil keeps the skin bacteria free. This means that coconut oil is giving your skin a double helping of beneficial effects. This promotes anti-aging effects for the skin as it fights off bacteria and strengthens the skin tissue.

Conclusion

By now you should be very excited about beginning your journey into the health benefits and extensive world of Coconut oil. Coconut oil really is one of nature's most wonderful products. It can help out in so many ways with your diet and your health that we should all be encouraged to switch our diets and improve our overall well-being.

Giving yourself a well- balanced diet and doing the best you can for your body is central to living a long and fruitful life. The fact that coconut oil can also treat a variety of common afflictions and illnesses serves only to strengthen the need to have some handy at all times. We hope you found this practical guide to the benefits of coconut oil useful.

So it is now time to start using coconut oil on a daily basis, you'll begin benefitting from all of the health-boosting properties. Start enjoying a healthier lifestyle with coconut oil.
